ABSTRACT

The present study surveyed the intestinal parasites which cause diarrhea in 600 children consulting Ibin-al_Ather hospital in Neinavah governorate for a period of 10 months using both direct smear and concentration technique for examining stool. The

total percentage of infection was 64.16% among those referred to the laboratory for stool examination. Four species of parasites were recorded: two species of protozoa, namely: *Entamoeba histolytica* 36.10% and *Giardia lamblia* 40.26% and two species of worms namely *Hymenolepis nana* 19.74% and *Enterobius vermicularis* 3.89%. Also the study extended to reveal the factors that affect the percentage of infection and symptoms associated with diarrhea.

The highest percentage of infection was in the age 1-2 years and the males had higher infection rate than females and children coming from rural regions more than those coming from urban region.
