**ABSTRACT**

Four pathogenic bacteria isolated from the sewage in this study: *Pseudomonas aeruginosa*, *Escherichia coli*, *Staphylococcus aureus* and *Proteus mirabilis*. *Escherichia coli* in addition to *Pseudomonas aeruginosa* were sensitive to the *Pseudomonas aeruginosa* bacteriophages that isolated from the sewage. Three other *Pseudomonas* species were tested for the sensitivity to the isolated bacteriophages only *Pseudomonas* species with green and yellow pigmentation on Nutrient agar were sensitive to the isolated phages.

**Key words**: Isolation, *Pseudomonas*, bacteriophage, sewage.
